Requirements Gathering

PortfolioGenie — Initial Software Requirements Specification

1. Purpose

This document records the initial user and system requirements for PortfolioGenie, a platform intended to help junior developers prepare a professional portfolio through a guided form, editing workflow, live preview, and AI-assisted writing support.

2. Stakeholders and User Persona

Primary Persona: Junior Developer

Attribute	Description
Profile	Student, graduate, or early-career developer seeking internships or junior roles.
Goals	Present skills and projects clearly and create a shareable professional portfolio.
Needs	Simple instructions, guided data entry, customization, live preview, and help improving text.
Pain points	Limited design experience, uncertainty about what to write, and difficulty organizing project information.
Accessibility considerations	Readable text, keyboard-friendly controls, clear labels, and responsive layouts.

3. Functional Requirements

ID	Requirement	Priority	Acceptance Criteria
FR-01	The system shall let the user enter basic profile information, such as name, role, biography, and contact/social links.	Must	Entered values appear correctly in the portfolio preview.
FR-02	The system shall let the user add, edit, and remove technical skills.	Must	The user can create a skill entry, update it, and remove it.
FR-03	The system shall let the user add, edit, and remove project entries.	Must	A project can include title, description, technologies, and optional repository/demo links.
FR-04	The system shall present portfolio creation as a multi-step form.	Must	The user can move between steps and receives clear validation feedback.
FR-05	The system shall provide navigation between the editor and live preview	Must	The editor and preview routes can be opened and navigated between.

Edit with WPS Office

	using React Router.		
FR-06	The system shall update the preview when relevant portfolio data changes.	Must	Changes to supported fields are reflected in the preview without re-entering the data.
FR-07	The system shall offer AI -assisted biography and project-description improvement.	Should, subject to approved brief and API access	The user can request a suggestion, review it, and choose whether to use it.
FR-08	The system shall provide feedback for missing or invalid required fields.	Must	Invalid input is identified with understandable messages.
FR-09	The system shall provide a way to view or share the completed portfolio.	Should; exact publishing method to be confirmed	The completed portfolio can be presented in a shareable format supported by the implementation.

4. Non-Functional Requirements

ID	Requirement	Acceptance Guidance
NFR-01	Responsive design	Core flows remain usable on mobile, tablet, and desktop sizes.
NFR-02	Accessibility	Form controls have labels, keyboard navigation is supported, and text contrast is considered.
NFR-03	Usability	Steps, navigation, validation, and actions are understandable to first -time users.
NFR-04	Maintainability	Components and reusable hooks have clear responsibilities and consistent naming.
NFR-05	Performance	Typing and preview updates should feel responsive under normal use.
NFR-06	Reliability	The user receives a clear error state if an optional AI request fails.
NFR-07	Privacy and security	Sensitive API keys must not be exposed in frontend source code; user data handling must be documented if a backend is added.
NFR-08	Compatibility	The core workflow should be tested in current major browsers.

5. Use Cases

UC-01: Create a Portfolio

- Actor: Junior Developer.
- Precondition: The application is open.
- Main flow: The user starts the form, enters profile information, adds skills and projects, reviews the

Edit with WPS Office

information, and opens the preview.

- Alternative flow: If required information is missing, the system identifies the relevant field and allows the user to correct it.
- Postcondition: The portfolio data is available for preview in the current application session; persistent saving depends on the final approved architecture.

UC-02: Improve Text with AI

- Actor: Junior Developer.
- Precondition: The user has entered a biography or project description and the AI feature is configured.
- Main flow: The user requests a suggestion, the system sends the text with a defined prompt to the AI service, and the result is displayed for review.
- Alternative flow: If the request fails or the service is unavailable, the system displays an error and preserves the original text.
- Postcondition: The user chooses whether to accept, edit, or discard the suggestion.

6. User Stories

- As a junior developer, I want to enter my information step by step so that creating a portfolio feels manageable.
- As a junior developer, I want to add projects and technologies so that recruiters can understand my practical skills.
- As a user, I want to see a live preview so that I can identify and correct presentation issues.
- As a user, I want AI suggestions for my biography and project descriptions so that I can communicate my experience more clearly.
- As a user, I want to edit or reject AI-generated text so that the final portfolio accurately represents me.

7. Constraints, Assumptions, and Open Questions

- The visible project brief explicitly names React Hooks (useState and useEffect), Custom Hooks for a multi-step form, React Router, UI/UX practices, AI prompt engineering, and clean code.
- The visible brief does not confirm whether a backend, database, user authentication, or a specific hosting provider is mandatory.
- The final method for saving and publishing portfolios must be confirmed before implementation.
- The AI provider, API cost/limits, and data-handling approach must be decided before enabling the AI feature.
- The team should confirm whether the evaluator expects a particular template count, design tool, testing format, or documentation standard.

8. Requirements Validation

- Review this document against the complete official PortfolioGenie brief.
- Ask the mentor to confirm the project scope and any mandatory technologies.
- Prioritize Must requirements before Should requirements.
- Use the acceptance criteria as the basis for the test cases during implementation.

9. Conclusion

This initial requirements specification translates the PortfolioGenie concept into implementable and testable functions. It should be reviewed with the mentor and updated if the complete DEPI brief contains additional mandatory requirements.
